

supplying the leading  
underfloor heating solution

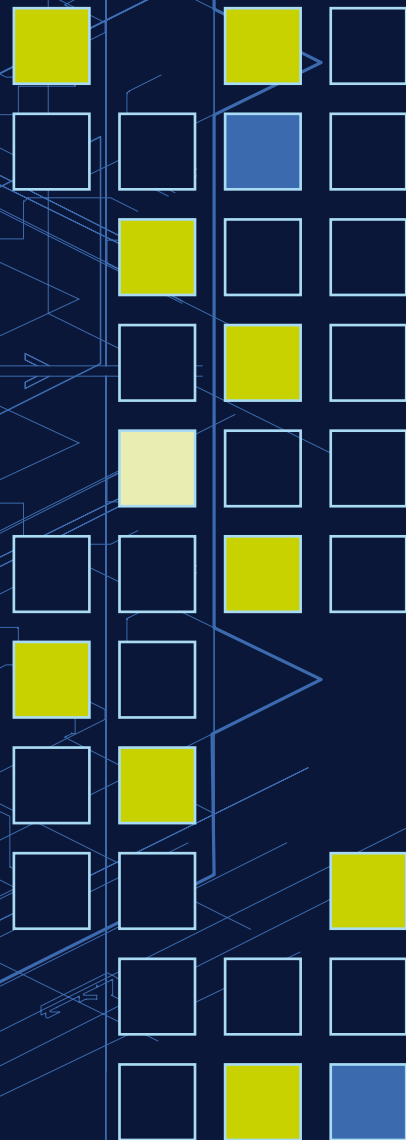

# RollaMat

## The time-saving underfloor heating system.

RollaMat takes the groundwork out of laying electric underfloor heating. Rather than having to lay, space and fix cables manually, it comprises a unique polypropylene grid with heating cables attached off-site.

Suitable for concrete and timber floors, the mat is cut to individual room size in the factory. The correct specification of heating cable is then fixed into place using precision CAD techniques to ensure a mat that is bespoke to each room.

- Eliminates the need for laborious and time-consuming cable laying
- Each mat is specifically designed for each room
- Fast and easy to install ready for final flooring in around 10 minutes
- No risk of cables moving once in position
- Precision factory-controlled cable spacing for consistent heating performance
- Cut to size in the factory from CAD drawings
- Fully tested and delivered, labelled according to its location within the building

supplying the leading  
underfloor heating solution

# RollaMat

## The time-saving underfloor heating solution

Unique to Thermal Reflections, RollaMat is an underfloor heating solution that is up to six times faster to install than conventional underfloor cabling. There's no risk of cables moving or being incorrectly spaced. Each mat is also designed specifically for the room resulting in a bespoke heating system that's faster, easier and more cost-effective to install.

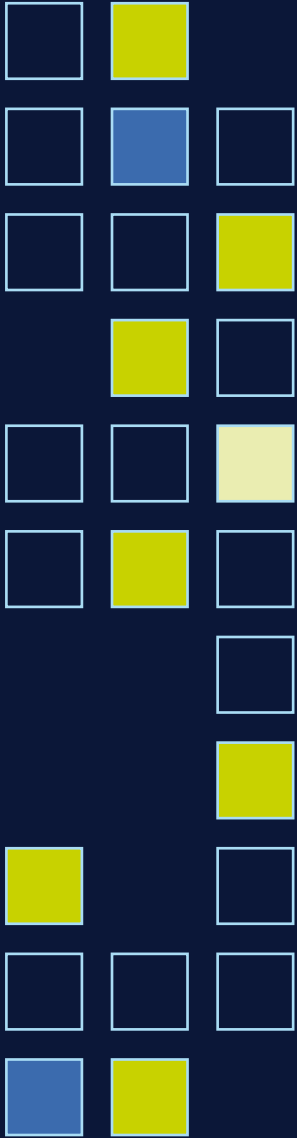

## Up to six times faster to install

Once on site, installation is fast and straightforward. The mat is simply unrolled in the room with the cable side uppermost for a screeded floor and down for a timber floor. An underfloor sensor is then fitted and the system is tested ready for the final flooring - all in around ten minutes compared with approximately one hour for conventional cabling.
